

# Analysis

## 1. Incident Description

A job offer was received for a data entry role. The task involved entering structured Excel data into Google Forms. The communication was initiated by an unknown contact and included a reference to a website.

## 2. Initial Observation

The described workflow appeared unusual, as Google Forms is typically used for collecting raw data rather than re-entering already structured data from Excel.

## 3. Suspicious Indicators

- The workflow (Excel to Google Forms) lacks a clear operational purpose
- No structured hiring process or verification was conducted
- Organizational details could not be independently verified
- Communication avoided logical clarification of the task
- Absence of official domain-based communication
- Interaction relied on informal channels rather than professional platforms
- Overall pattern aligns with known social engineering job scams

## 4. Behavioural Analysis

The sender avoided responding to logical questions regarding the workflow. This behaviour indicates an attempt to prevent deeper scrutiny, which is a common tactic in social engineering attacks.

## 5. Technical Observation

A website was provided during the interaction. However, the legitimacy of the organization could not be independently verified through trusted

professional sources. Additionally, no official domain-based email communication was observed, and interactions were conducted through informal means.

## 6. Conclusion

Based on the identified indicators and behavioral patterns, the job offer shows a high likelihood of being a social engineering-based scam attempt.
