

Report

Title

Social Engineering Job Scam Detection & Analysis

1. Executive Summary

This report analyzes a suspected job scam involving a data entry task. The interaction displayed multiple indicators of social engineering, including an illogical workflow and lack of verifiable organizational details. Based on the analysis, the risk level is assessed as high.

2. Incident Description

A job offer was received for a data entry role. The task involved entering structured Excel data into Google Forms. The communication was initiated by an unknown contact and included a reference to a website.

3. Observation

The described workflow appeared unusual, as Google Forms is typically used for collecting raw data rather than re-entering already structured data from Excel.

4. Indicators of Compromise

- The workflow (Excel to Google Forms) lacks a clear operational purpose
- No structured hiring process or verification was conducted
- Organizational details could not be independently verified
- Communication avoided logical clarification of the task
- Absence of official domain-based communication

- Interaction relied on informal channels rather than professional platforms
- Overall pattern aligns with known social engineering job scams

5. Behavioural Analysis

The sender avoided responding to logical questions regarding the workflow. This behaviour indicates an attempt to prevent deeper scrutiny, which is a common tactic in social engineering attacks.

6. Technical Observation

A website was provided during the interaction. However, the legitimacy of the organization could not be independently verified through trusted professional sources. Additionally, no official domain-based email communication was observed, and interactions were conducted through informal means.

7. Risk Assessment

Risk Level: High

The interaction shows multiple indicators of a social engineering scam, which could potentially lead to financial loss or misuse of personal information.

8. Recommendations

- Verify company identity through trusted sources
- Avoid engaging with offers lacking formal hiring processes
- Do not share personal or financial information
- Report suspicious activity to cybercrime authorities

9. Conclusion

The analyzed interaction demonstrates characteristics consistent with known job scam techniques. Users should exercise caution and verify all job offers before engagement.
